Lab Exercise 10– Install Terraform on Windows

Installing Terraform on Windows requires you to download the correct Terraform package, unpack, and execute it via the CLI. Follow the instructions below to ensure you do not miss any steps.

Download Terraform File for Windows

To find the latest version of Terraform for Windows:

1. Browse to the Download Terraform page.

2. Select the Windows tab under the **Operating System** heading. The latest version is preselected.

3. Choose the binary to download. Select 386 for 32-bit systems or AMD64 for 64-bit systems. Choose the download location for the zip file if the download does not start automatically.
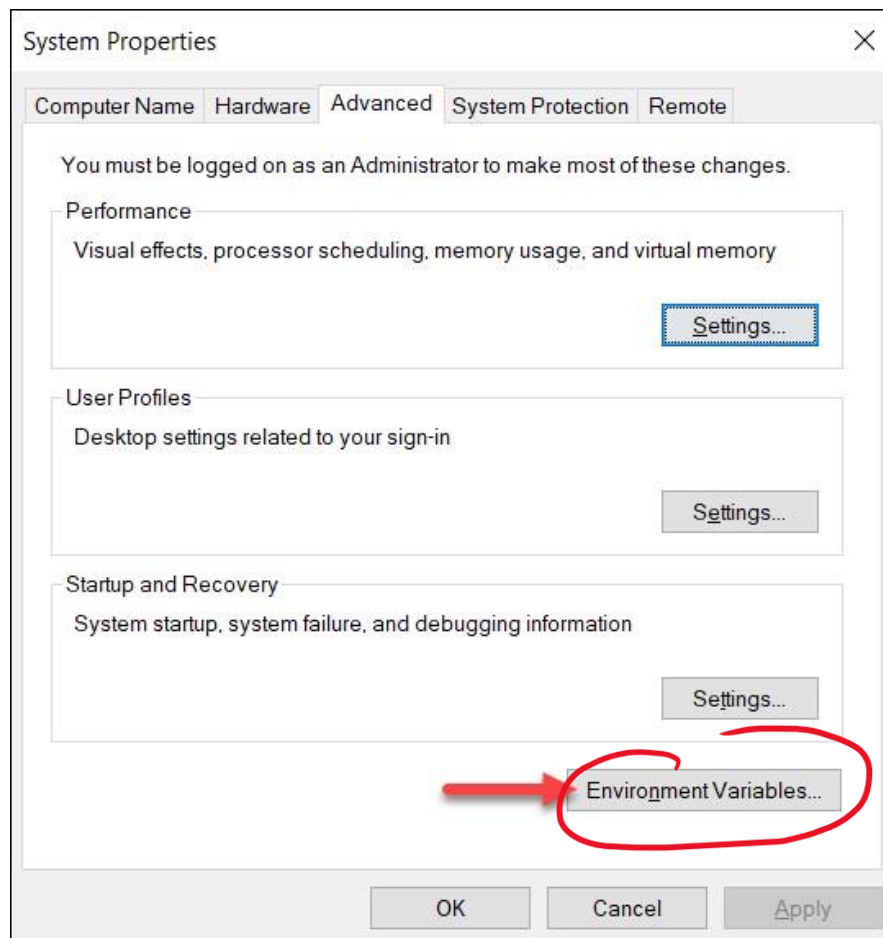

4. Unzip the downloaded file. For example, use _____ the _C:\terraform_ path. Remember this location _____ so you can add the path to the environment variables.

## Add Terraform Path to System Environment Variables

To add the Terraform executable to the system's global path:

1. Open the start menu, start typing _environment_ and click **Edit system environment variables**. The System Properties window opens.
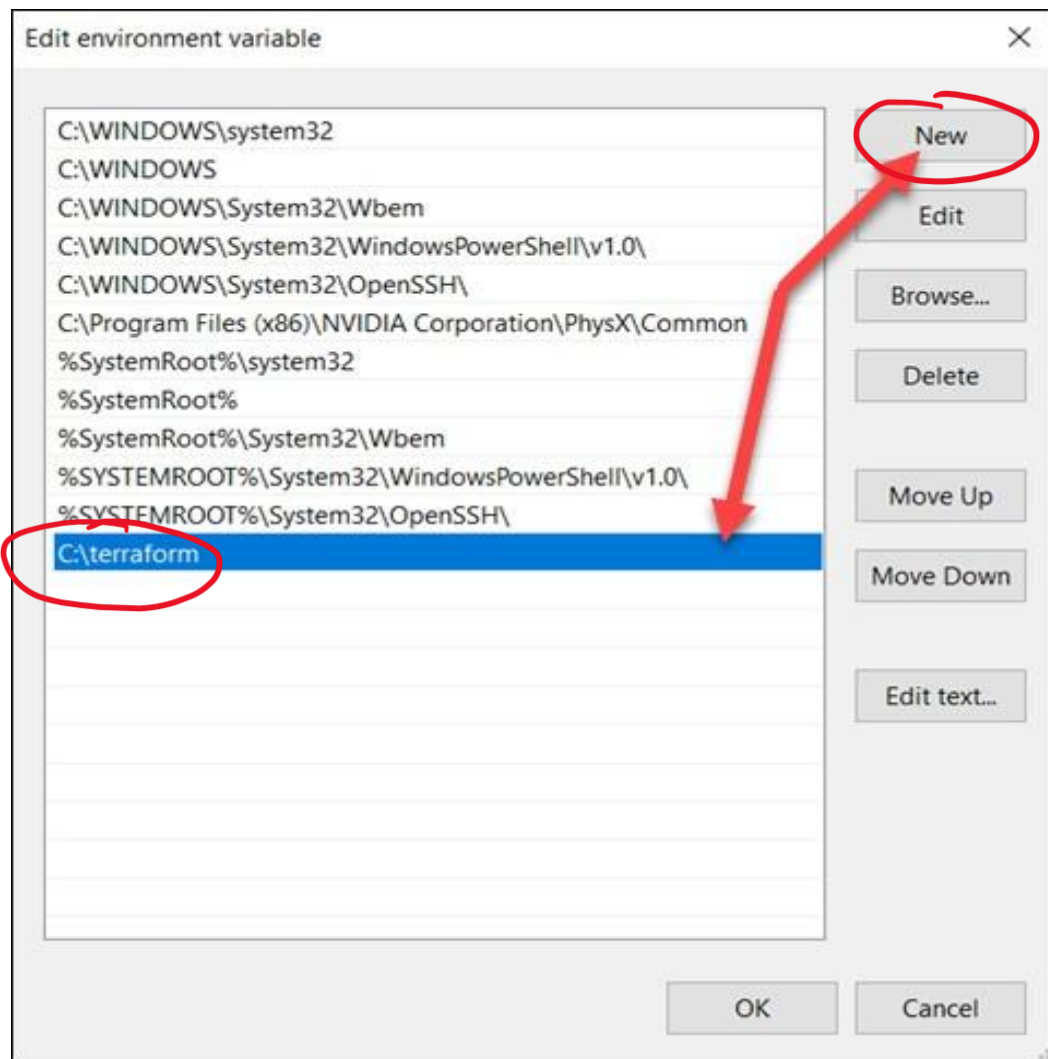

2. Click the **Environment Variables…** button.

3. Select the **Path variable** in the System variables section to add terraform for all accounts. Alternatively, select **Path** in the **User variables** section to add terraform for the currently logged-in user only. Click **Edit** once you select a Path**.**

4. Click **New** in the edit window and enter the location of the Terraform folder.

5. Click **OK** on all windows to apply the changes.

Verify Windows Terraform Installation

To check the Terraform global path configuration:

1. Open a new command-prompt window.

2. Enter the command to check the Terraform version: terraform -version

```
terraform -version
```

```
PS C:\Users\Rachit> terraform -version
Terraform v1.14.0
on windows_amd64
PS C:\Users\Rachit>
```

The output shows the Terraform version you downloaded and installed on your Windows machine.
